

PROJECT PROFILE

PROJECT: BREWERY TANK REFURBISHMENT

THE PROBLEM

The internal surfaces of two steel tanks at this brewery had been earmarked for refurbishment.

A high performance lining system was sought that would be suitable for use in a dark processing environment.

THE SOLUTION

The internal surface of each steel tank was abrasive blast cleaned to a minimum industry standard of SSPC -SP5, ensuring all loose abrasive dust and debris was removed. The substrate was then treated with two coats of Chemi-Tech PW.

Chemi-Tech PW is a two component, solvent-free epoxy coating designed for use as a lining system for the protection of tanks, pipes and associated equipment handling drinking water and liquids used in food and drink processing industries.

Chemi-Tech PW offers excellent abrasion, impact and erosion resistance as well as exceptional water and corrosion resistance. It meets USDA/FDA requirements for use in food preparation areas and has been approved by the Water Regulations Advisory Scheme for contact with potable water.
