

Project: Cooling Tower Supports

The Problem

These cooling tower supports were corroding from environmental effects as well as salts and chlorides.

The Solution

RPT pressure washed the supports and coated them with two coats of **Thortex Corro-Tech GP** followed by a top coat of **Thortex Poly-Nox**.

RPT used the same system on 30 more supports for this customer over the last 5 years with no system degradation.

Thortex Corro-Tech GP is a high-performance, anti-corrosive coating for use on new and existing steel structures for long-term protection where surface preparation is restricted.

Thortex Poly-Nox is a high-performance, acrylic coating that has excellent elastomeric and corrosion resistant properties with an optimum level of UV resistance, adhesion and durability for ferrous and cementitious surfaces.
